Import / Export Data Overview

Data can be imported into or exported from either an **Individual Vault** or a **Shared Vault**.

In this way, data can be exported from one vault and the data reimported into another Vault.

- **Import Data:** Data can be imported into a Vault using a **variety** of **file formats**. Data is **encrypted locally** before being sent to the server for storage.
- **Data Import Errors** : If the data does not conform with the WALLIX Enterprise Vault data requirements, a **data import error message** is displayed. The data can be **corrected** before being imported.
- **Export Unencrypted Vault**: A Vault can be exported and downloaded to your computer without first being encrypted. This is possible for Individual and Shared Vaults.
- **Export Encrypted Vault**: A Vault can be encrypted using one of two methods (**Account restricted** or **Password protected**) before being exported.
- **Reimport Encrypted Export**: When data is exported using the **Account Restricted m** ethod, it can be **reimported** into the **same vault**.
